

BUSINESS APPLICATIONS OF AI

Module 5 — The Pitch

Palm Beach Atlantic University · Graduate Program

The Rest of the Canvas, and The Pitch

"You're not selling software. You're selling transformation."

Learning Objectives

By the end of this chapter, you will be able to:

- Complete all nine blocks of the Business Model Canvas with investment-grade specificity, including Channel, Customer,

5.1 Finishing the Business Model Canvas

In Chapters 2 through 4, you built the foundation: a pain-first value proposition, a precisely defined Ideal Customer Profile, and a unit economics model that separates viable businesses from expensive hobbies. The Business Model Canvas has nine blocks. You have rigorously addressed four. This section completes the canvas — not as a form-filling exercise, but as a strategic pressure test.

Channels: How Customers Find You and How You Reach Them

A channel is the route through which your value proposition reaches the customer. The choice of channel is not a marketing decision — it is a structural one that determines your CAC, your sales cycle, and whether your go-to-market motion matches your ICP.

The five primary channel motions for AI-native businesses are:

Direct (Field Sales): You hire salespeople who call, email, and close deals. High-touch, high-CAC. Works when ACV (Annual Contract Value) exceeds roughly \$25,000, because the economics of a human sales cycle require a large enough deal to justify the cost. Enterprise AI compliance tools, custom model deployments, and agentic workflow platforms often go direct.

Partner / Channel Reseller: You sell through a third party — a systems integrator, a consulting firm, or a platform marketplace (e.g., Salesforce AppExchange, AWS Marketplace). Lower upfront CAC but margin compression and dependency risk. Appropriate when your ICP already buys through that partner and when your product extends rather than competes with the partner's offering.

Product-Led Growth (PLG): The product sells itself. Freemium tiers, viral loops, and bottom-up adoption let individual users discover and champion your product inside their organization. PLG works when the value is immediately demonstrable, when switching costs are low enough to get someone to try but high enough to keep them, and when the per-seat expansion model is in place. Cursor, Notion, and Figma all scaled primarily through PLG before adding enterprise sales.

Sales-Led Growth (SLG): A traditional top-down motion in which a centralized buying decision is made by economic buyers (VP, CTO, CFO). Works for regulated industries, multi-department deployments, and any context where legal review or security certification is required before a user can even touch the product.

Community-Led Growth: The community — a Slack group, Discord server, an open-source

repository, a newsletter, or a cohort program — drives product adoption. Developer tools, AI infrastructure products, and platforms targeting founders or operators often use community-led motions because trust is established through peer endorsement before commercial engagement.

Matching Channel to ICP: The critical principle is fit. A PLG motion for a product whose ICP is a risk-averse CFO at a regulated bank will fail. A field-sales motion for a \$29/month tool targeting freelancers will bleed CAC. The channel must match where your ICP already goes to discover solutions, how much trust is required before they buy, and what price point can support the friction of that channel.

Customer Relationships: Self-Serve vs. High-Touch

Customer relationships define the type of interaction you maintain with each customer segment. The spectrum runs from fully automated self-serve (no human involvement) to dedicated personal assistance (a named human owns the relationship).

Where AI changes the cost curve is significant. Self-serve used to mean "the customer is on their own." AI-powered onboarding, in-product assistants, automated QBRs (Quarterly Business Reviews), and AI-generated success playbooks now allow a company to deliver what previously required a customer success team — at near-zero marginal cost per customer.

Many student pitches propose a high-touch relationship model "for now, while we're small" with a plan to automate later. Investors hear this as: "We have not thought about unit economics." Build the automation into the architecture from day one. High-touch should be reserved for your top 10% of accounts by ACV, not used as a default because automation feels cold.

The relationship model also affects NPS, churn, and expansion revenue. Customers who are left to figure things out alone churn when the first obstacle appears. Those who are over-managed with weekly check-in calls resent the intrusion and churn when they realize they never needed you that much. The goal is calibrated relationship intensity: automated for the long tail, tiered personal attention for accounts where lifetime value justifies the spend.

Revenue Streams: Subscription, Usage, and Outcome

Three dominant revenue architectures exist for AI-native businesses:

Subscription (Seat-Based or Flat): Predictable recurring revenue. Easy to model. Customers know what they'll pay. Risk: the "shelfware" problem — customers pay but don't use, then churn at renewal because they cannot justify the cost.

Usage-Based (Consumption): Customers pay for what they use — API calls, tokens processed, hours of automation, documents analyzed. Aligns incentives (you win when they win), scales naturally with customer success, but introduces revenue volatility that makes financial forecasting harder and sometimes spooks investors unfamiliar with the model.

Outcome-Based: The most ambitious and hardest to structure. You charge a percentage of the value created — cost savings delivered, revenue generated, time reclaimed. Works when outcomes are measurable and attributable, when your contract terms allow for audit rights, and when trust in your methodology is established. Rarely viable for early-stage companies without strong references.

Tier Design Principles: When designing pricing tiers, three rules apply. First, tiers should expand

with value delivered — the customer who uses your product more pays more because they're getting more. Second, the free or starter tier should create genuine habit, not just exist as a demo environment. Third, the jump from one tier to the next should be triggered by a natural usage ceiling that the customer feels organically, not by an arbitrary limit that feels like a trap.

Key Resources: What Competitors Cannot Cheaply Replicate

Key Resources are the assets your business model requires to deliver the value proposition. For AI-native businesses, the critical resource question is not "what do we have?" but "what do our competitors not have and cannot easily acquire?"

The most defensible resources in AI businesses:

- Proprietary data: Training sets, behavioral data, longitudinal digital clinical records, user-generated outputs that improve

If your key resource section reads "we will build a large proprietary dataset," investors will ask when you will have it, how you will collect it, and what protects you from a well-funded competitor doing the same thing faster. "We're building it" is not a resource. Resources exist at pitch time, or they are assumptions — label them accordingly.

Key Activities: The Three Things You Must Be Great At

Key Activities are what you must execute excellently for the business model to function. The mistake most founders make is listing too many — twelve activities that are equally important means none of them are actually priorities.

For an AI-native business, the three that matter most are typically:

- Model improvement: Continuously making the core AI capability better based on customer feedback, new data, and infrastructure

invest-
ment.

- Customer acquisition and activation: Getting the right customers in the door and making sure they experience value before their attention shifts

Key Partnerships: Who You Need — and Who to Avoid Depending On

A partnership is a supplier, platform, or co-marketing relationship that is structurally necessary for your business to function. The risk of a key partnership is dependency: if the partner changes terms, goes out of business, or becomes a direct competitor, your business is exposed.

Partnerships to pursue: integration partners whose platform your ICP already lives inside, distribution partners who have trust with your buyer already established, and infrastructure providers with strong contractual stability.

Partnerships to avoid depending on: any single large platform whose API terms can change without notice, any partner whose roadmap could make your product redundant, and any channel partner whose incentives are not aligned with your customers' success.

5.2 Investors Fund Businesses, Not Apps

There is a failure mode that appears so frequently in student and early-stage pitches that it deserves its own frame: developer thinking versus entrepreneur thinking.

Developer thinking frames problems as technical challenges and solutions as features. A developer-thinker's pitch describes what the product does, walks through the interface, explains the architecture, and concludes with a pricing page. The implicit assumption is: "If you understand what it does, you will want to buy it."

Entrepreneur thinking frames problems as market opportunities and solutions as value delivered to specific humans who will pay for that value. An entrepreneur-thinker's pitch opens with the pain, proves the pain is real and widespread, introduces the solution as a mechanism for transformation, and closes with evidence that the company can win.

Investors are not evaluating your code. They are evaluating whether a business exists around your code. The five dimensions every investor assesses — often before slide 6 — are:

- Team: Can they see founders learn fast enough to find their

5.3 The Transformation Framework

A pitch is not a product tour. It is a story about transformation — the world before your company, and the world after. The Transformation Framework provides a repeatable structure for building that story.

Step 1 — Paint the After Picture

Start with the world your customer inhabits after your product solves their problem. Not what your product does — what life is like when it works. A freight logistics company whose CFO no longer loses sleep over invoice reconciliation. A healthcare administrator who discharges patients 40 minutes faster because prior authorization is automated. Before the investor cares about how you build it, they need to viscerally desire the outcome.

Step 2 — Connect to Emotion

The after picture must connect to something the investor has felt or can imagine feeling. Frustration, anxiety, embarrassment, missed opportunity — these are the emotional raw materials of a compelling pitch. Data creates credibility; emotion creates investment. The best pitches pair a specific human story (a named person, a real situation) with the broader market thesis.

Step 3 — Explain the How

Now — and only now — introduce the mechanism. How does your product create the transformation you described? This is where the technology lives in the story. Keep it at the level of "what it does" rather than "how it's built." The mechanism should feel inevitable: of course this is how you solve that problem.

Step 4 — Anchor in Data

The story needs evidence. Market size data, customer quotes, retention numbers, a compelling case study, or early NPS scores — whatever you have that proves the problem is real, the solution works, and people are willing to pay. Data without story is a spreadsheet. Story without data is a pitch from someone who hasn't done the work. You need both.

Step 5 — Prove You Can Win

This is the most underserved step in student pitches. Proving you can win requires answering the "why you?" question with specificity: proprietary access to data, domain expertise that took years to build, a distribution relationship competitors cannot replicate, or early traction that proves market validation. Generic claims ("we have a great team") do not satisfy this step.

Step 6 — Make the Ask Specific

"We are raising a round" is not an ask. "We are raising \$1.5M on a SAFE with a \$10M cap, which funds us to \$750K ARR by Month 18, at which point we will have enough proof to raise a Series A at

better terms" is an ask. Investors respect founders who have done the capital planning. The specific ask signals financial sophistication, not desperation.

```

  style A fill:#3b82f6,color:#fff
  style F fill:#f97316,color:#fff
```

5.4 The 10-Slide Architecture

Every investor has seen hundreds of pitch decks. They have also sat through hundreds of pitch meetings. Pattern recognition is working for and against you: for you, because a well-structured deck signals professional maturity; against you, because any structural deviation creates cognitive friction that breaks trust.

The 10-slide architecture below is not a template — it is a sequence of investor questions answered in the order investors ask them.

Slide #	Slide Name	Job It Must Do
1	The Hook	Make the investor lean forward. Open with the most compelling
2	The Problem	Define the pain while specifically Quantify it. Identify who feels it and
3	The Solution	Introduce your product as the answer to slide 2. One sentence of
4	Why Now	Explain the timing of change. What has shifted technically, commercially,
5	Market Size	TAM !' SAM !' SOM. Use bottoms-up math, not top-down market
6	Business Model	How you make money. Why you don't
7	Traction	Your strongest evidence that this is real. Revenue, LOs, pilot results,
8	Competition	to show you've done enough research to know your competitive
9	Team	Why you. Relevant experience, domain expertise and evidence of
10	The Ask	Amount in currency (\$/£/€), or convertible note, results cap or revenue cap, etc. Be specific. Reiterate the total and the per person near-term needs. Use slide 1 maximum clarity.

5.5 Show, Don't Tell: The Live Demo

A working demo is worth ten slides of mockups. Mockups are promises. A live product is evidence. The moment an investor sees a real product doing a real thing, the cognitive burden of "does this actually work?" disappears — and their attention shifts to "can this team scale it?"

What to Show

Show the full journey from input to output — the moment that makes the investor think "I can't believe this is possible." For an AI product, that moment is usually the first time the model does something that feels like magic: summarizing a complex document in three seconds, generating a contract clause on demand, flagging a fraudulent transaction in real time. Build the demo to reach that moment as quickly as possible.

What to Skip

Skip the login screen. Skip the account settings. Skip anything that doesn't directly demonstrate value. Every second of a demo that doesn't deliver a "wow" moment is a second where the investor's attention is available to drift.

What to Never Debug Live

Never fix a broken demo during a pitch. If something fails, acknowledge it calmly ("let me show you the same thing in our test environment"), move to a backup, and keep the energy steady. The worst demo failures are not technical — they are emotional: the founder who panics, who becomes visibly frustrated, who loses the narrative thread while trying to troubleshoot. Composure under pressure is itself a signal investors are watching for.

Using Claude Code to Prototype in Hours

Modern AI coding environments — including Claude's coding interface — can produce functional proof-of-concept demos in hours rather than weeks. A working prototype does not need to be production-grade. It needs to demonstrate the core mechanic: that your AI can do the thing you claim it can do. Build the demo first. Build the infrastructure later.

The Narrator Mode Rule

Never go silent during a demo. The investor does not know what they're looking at unless you tell them. Use "narrator mode": describe what is happening and why it matters as it happens. "I'm entering a sample contract here — this would normally take a paralegal 45 minutes to review. Watch what happens in the next 8 seconds." Narration converts a product demonstration into a story, and stories are retained.

```
**Hour 1-2:** Define the one core mechanic you want to demonstrate. Write it as a user story: "As a [user], I want to [action] so that [outcome]." Resist the temptation to add features.
```

```
**Hour 3-6:** Use an AI coding environment to scaffold the application. Prompt for the core function first, then the UI wrapper. Focus entirely on the "magic moment" — the output that will make the investor lean forward.
```

```
**Hour 7-10:** Test the demo path end-to-end at least 20 times. Remove every step that is not the magic moment. Add a fallback state (a recorded version of the output) for any step that might fail.
```

```
**Hour 11-14:** Practice the narration. Record yourself demoing. Watch it back. Cut anything that doesn't add to the story.
```

```
**Hour 15-16:** Prepare three backup states: a live demo, a local version without internet dependency, and a screen recording. Know exactly when to switch.
```

5.6 Handling Objections

Objections are not rejections. They are questions that an investor is not comfortable asking directly. The founder who hears an objection as an attack — and responds defensively — loses the room. The founder who hears an objection as an opportunity to demonstrate sophistication and honesty wins it.

Investor objections cluster into five categories:

Market Objections

Case Study: Three Pitches — One That Raised, One That Stalled, One That Was Rejected

Pitch A: The One That Raised

Company: An AI-powered clinical documentation tool for outpatient clinics.

What worked: The founder opened with a video — 42 seconds of a burned-out physician describing the two hours of daily documentation that was driving her to leave medicine. No investor in the room had experienced physician burnout personally. Every investor understood by the end of the video that the pain was real, serious, and costly. The founder then showed a live demo — a 90-second clip of the product converting a physician's verbal summary into a complete SOAP note. The product worked, demonstrably, in the first five minutes.

The moment it won: Slide 3. The demo. Investors who needed convincing were convinced before the business case was presented. Everything after was confirmation, not persuasion.

Pitch B: The One That Stalled

Company: An AI contract review platform for mid-market legal teams.

What stalled it: The product was genuinely excellent. The demo was polished. The unit economics were defensible. But the pitch opened with the architecture — a 10-minute walkthrough of how the NLP pipeline processed documents — before any investor had been given a reason to care about contract review. By the time the founder reached the pain and the market, the room had decided this was a feature, not a business.

The moment it stalled: Slide 1. The founder led with technology, not transformation. The investors passed. The company later re-pitched with a completely restructured deck leading with customer pain and raised the round within 60 days.

Lesson: A great product in a bad story structure looks like a bad product. Structure is not presentation hygiene — it is the argument itself.

Pitch C: The One That Was Rejected

Company: An AI productivity tool for knowledge workers.

Why it was rejected: The TAM was cited as "the global productivity software market" — a figure derived from a single market research firm's report. When an investor asked how many people would actually pay \$49/month for a productivity layer when free alternatives existed, the founder deflected without answering. The team had no domain expertise in enterprise software sales. The product had no paying customers. The ask was \$2M.

The moment it was rejected: Q&A, first question. The inability to defend the market sizing without the research report was fatal. Investors are not buying a market research report. They are buying a founder's conviction and evidence.

Lesson: Know the numbers from the inside out. If an investor removes your slides, you should still be able to make the entire case from memory.

Faith Integration — Module 5

*"An honest witness tells the truth, but a false witness tells lies."
— Proverbs 12:17 (NIV)*

Truth-Telling in the Pitch Room

The pitch room is one of the highest-pressure environments a founder will ever enter. Careers, capital, and credibility hang in the balance. Under that pressure, the temptation to shade the truth — to make the TAM look bigger, the traction look stronger, the team look more complete — is significant and well-documented.

Proverbs 12:17 draws a simple but sharp line: honest witness versus false witness. There is no gray zone, no "strategic ambiguity," no "investor-friendly framing" that crosses into misrepresentation. The Christian entrepreneur is called to tell the truth about their business — including the risks, the gaps, and the assumptions that haven't been validated yet.

This is not naive. Sophisticated investors actually prefer founders who demonstrate clear-eyed awareness of their business's weaknesses. The founder who can say "here is where we are vulnerable and here is what we are doing about it" is more credible, not less, than the one who projects unbroken confidence. Honesty is not only ethically required — it is often strategically superior.

But the biblical call to truth goes deeper than self-interest. An investor who is misled loses money. An employee who joins a company under false pretenses may derail their career. A customer who is over-promised and under-delivered suffers real harm. The ripple effects of dishonesty in the pitch room extend far beyond the founder's own reputation. A Christian business professional takes those ripple effects seriously — because those people matter, not just instrumentally, but as image-bearers of God.

' p Faith Integration Paper — Module 5

Assignment: Using Claude or Gemini as a co-writer, compose a 1-page reflection paper (approximately 300–400 words) responding to the following prompt:

Proverbs 12:17 calls you to be an honest witness about your business. As you prepare your pitch, identify one place where you are tempted to present something more favorably than the evidence strictly warrants — and write about why that temptation exists and what it would look like to resist it. What does it mean to be radically transparent in a pitch without "torpedoing" your own deal? How do Christian integrity and investor credibility align — and where do they tension?

Format: 1 page, double-spaced, 12pt font, Times New Roman. Include Proverbs 12:17 at the top.

Grading: Courage of honesty, theological engagement, connection to your actual pitch.

Lab 5: The Pitch

This is the culminating deliverable for the first half of the course. Every component builds on the work from previous chapters.

Deliverable 1: Complete BMC Narrative (2 Pages)

Write a two-page narrative (not a filled canvas — prose) that explains all nine blocks of your Business Model Canvas with investment-grade specificity. For each block, the reader should understand:

-

ost ris
k in t
hat bl
ock

Starter Prompt: "Given our target customer [ICP description] and our value proposition [description], help me think through the trade-offs between a PLG and sales-led channel motion, including the CAC implications for each."

Deliverable 2: 10-Slide Pitch Deck

Build a complete 10-slide pitch deck following the architecture from Section 5.4. Each slide must be designed and contain actual content — no placeholder text. The deck will be evaluated on:

- P
ain cl
ariti

out

Starter Prompt: "I'm building a demo of [product description]. Help me identify the single most compelling 'magic moment' I should build toward, and suggest the minimum viable feature set to demonstrate it credibly."

Deliverable 4: Live Pitch to Panel (5-Minute Pitch + 10-Minute Q&A Defense)

Present your pitch live to a panel of evaluators. You will have 5 minutes to deliver the pitch and 10 minutes to defend it under questioning. Panels will use the five investor evaluation dimensions from Section 5.2. Evaluators may include faculty, external practitioners, or peer reviewers.

Evaluation criteria:

- Transformation Framework (Steps 1–6 present and effective)
- Demonstration of execution (live, narrated, "magic moment" achieved)
- Objective handling (ans

Starter Prompt: "I want to build a web app called the Pitch Mirror. It takes a 10-slide pitch deck outline as input and returns slide-by-slide feedback. Help me write a thorough system prompt for this app that defines the evaluation criteria for pain clarity, transformation framing, and investor-readability — and generates structured output with numerical scores and specific improvement suggestions."

Discussion Prompts

Prompt 1: The "Features First" Trap

Read the following claim: "Investors who don't see the technical innovation first are not sophisticated enough to evaluate AI companies. The product should lead."

Take a position and defend it using at least two scholarly sources published no more than two years old. Consider: at what stage of fundraising (pre-seed, seed, Series A) might the technical case carry more or less weight? What does the literature on investor cognition and decision-making suggest about narrative structure in high-uncertainty environments?

Post your initial response (minimum 350 words), then respond to at least two peers whose position differs from yours. Focus on the evidence — not the assertion.

Prompt 2: Outcome-Based Pricing and Trust

Outcome-based pricing — charging customers a percentage of measurable value delivered — aligns incentives more closely than subscriptions or usage-based models. Yet very few AI companies use it.

Using at least two scholarly sources no more than two years old, analyze the conditions under which outcome-based pricing becomes viable for AI businesses. What trust mechanisms, measurement infrastructure, and contractual frameworks are required? Find one real example of a company that has implemented outcome-based pricing at scale and evaluate whether the model has held up under scrutiny.

Post your initial response (minimum 350 words), then respond to at least two peers, focusing on whether their examples hold up to the viability criteria you identified.

Glossary

Business Model Canvas (BMC)

A strategic management template created by Alexander Osterwalder that maps nine building blocks of a business model on a single page: Customer Segments, Value Propositions, Channels, Customer Relationships, Revenue Streams, Key Resources, Key Activities, Key Partnerships, and Cost Structure.

Channels

The routes through which a company delivers its value proposition to customer segments, including direct sales, partner resellers, product-led growth, and digital platforms.

Customer Relationship Model

The type of relationship a company establishes with each customer segment, ranging from fully automated self-serve to dedicated personal account management.

Product-Led Growth (PLG)

A go-to-market strategy in which the product itself drives user acquisition, expansion, and retention – typically through freemium models, viral loops, or self-service onboarding.

Sales-Led Growth (SLG)

A go-to-market strategy in which a dedicated sales team drives customer acquisition through outbound prospecting, enterprise negotiation, and centralized buying decisions.

Revenue Architecture

The structural design of how a company generates income, including the combination of subscription, usage-based, and outcome-based models, tier design, and expansion mechanics.

Key Resources

The most important assets required by a business model to deliver its value proposition, including physical, intellectual, human, and financial resources.

Key Activities

The most important actions a company must perform to operate its business model and deliver its value proposition effectively.

Key Partnerships

The network of suppliers, partners, and other external entities that help optimize the business model, reduce risk, or acquire resources.

Transformation Framework

A six-step narrative structure for investor pitches: Paint the After Picture, Connect to Emotion, Explain the How, Anchor in Data, Prove You Can Win, and Make the Ask Specific.

The Ask

The specific funding request in an investor pitch, including the amount, financial instrument (SAFE, note, equity), valuation or cap, use of funds, and the milestone the capital is designed to reach.

Narrator Mode

A demo technique in which the presenter provides continuous verbal context about what is happening on screen and why it matters, converting a product demonstration into a story.

Investor Objection Taxonomy

A classification of common investor objections into five categories – market, product, competitive, team, and economic – each requiring a distinct response strategy.

Outcome-Based Pricing

A revenue model in which a company charges customers based on measurable outcomes delivered rather than seats, usage, or time.

SAFE (Simple Agreement for Future Equity)

A financial instrument commonly used in early-stage startup fundraising that gives investors the right to receive equity at a future priced round, typically including a valuation cap and/or discount.

Defensibility

The set of structural advantages – proprietary data, network effects, regulatory position, switching costs, or distribution – that protect a company's market position from competition.

Demo Choreography

The deliberate design of a live product demonstration, including the sequence of actions, the "magic moment" that creates peak investor engagement, and the contingency plan for technical failures.

Capital Efficiency

A measure of how much value (revenue, milestones, market proof) a company generates per dollar of capital raised and deployed.
